Commercial components Autodesk has also introduced the capability to integrate their products into other applications through plugins. These allow a product to provide additional features and functionality within the main application. Many of the top enterprise applications today offer plugins for AutoCAD. AutoCAD has a rich plugin structure to support integration into other software, which is essential to provide additional functionality. AutoCAD comes with numerous object and graph management APIs to allow for plugins to interact with Autodesk products, including AutoCAD, for example, the DWG load and save API to allow programmatic access to DWG data. The ADOPT (Autodesk Design Object API Technology) object management APIs include object hierarchy, linking, add and insert objects, remove objects and search and compare objects. In August 2008 Autodesk announced the availability of a CAD data migration API to allow an application to import and export data in the format of choice, including the ability to scale the data to support the users work area. The API has the capability to scale, transfer and delete imported data. Autodesk also offers a specific line of CAD data management products that were developed to provide CAD functionality to other applications. These CAD data management products, AutoCAD 2000, AutoCAD LT, AutoCAD Architectural Desktop, AutoCAD Civil 3D, AutoCAD Electrical and AutoCAD Mechanical, provide a number of features including rendering, data conversion, R/F projection, feature management and annotation that will assist other software programs. Users also need to be aware of the licensing model with this API. For example, if a plugin is developed on a Windows platform, it will be licensed on a per-user basis. However, if the development is done on a Macintosh platform, the license is on a per-machine basis.
