We compared the effects of high-fat feeding and treadmill exercise on plasma lipid and lipoprotein concentrations in Sprague-Dawley and Fischer 344 rats. The results suggest that fat feeding alone, without exercise, increases plasma lipid and lipoprotein concentrations and that both dietary fat and exercise increase plasma triglycerides. Exercise had synergistic effects on total cholesterol in both strains, and for total cholesterol and low-density lipoprotein cholesterol in the Sprague-Dawley rats. Diet and exercise had additive effects on high-density lipoprotein cholesterol in both strains. Compared with control animals, the dietary-fat-fed and exercise-trained animals had higher total and high-density lipoprotein cholesterol concentrations and lower triglyceride and low-density lipoprotein cholesterol concentrations
